1. Equipment Specifications

1.1 Powered Quadrant

Pull Force 2 Te. In both directions

Max Grip Force – Mechanically adjustable 500kg

Maximum Designed Speed 17 rpm

Minimum Designed Speed 1 rpm

Track Opening 250 mm

Maximum cable diameter 250 mm

Minimum cable diameter 50 mm

Minimum Bend Radius 4500mm

Maximum Operating Pressure 180 bar

Required Flow 140L/min

Drive Wheels - 4 off Hydraulically driven Solid Rubber material

Grip Wheels - 4 off Dunlop Pneumatic DR15854T

Grip Wheel Tyre Pressure 6 Bar

Equipment Manual ED 065 Page 6 of 13

1.2 HPU Specification

Prime mover: 55 kW, 4 pole, squirrel cage

motor

3ph; 400/460V; 50/60Hz

Full load current

d current 100 Amps

Main pump - Parker PVP100362R2A 10

Variable Volume piston pump

Main pump theoretical displacement

100 cc/rev

Max flow @ 1460rpm (50 Hz)

146 l/min.

Max flow @ 1800 rpm (60 Hz)

180 l/min.

Max operating pressure

180 Bar

HPU Cooler type

Oil/ Air Hydac OKA- EL6

Cooler max. Air consumption

60 M³/min

2. Description

2.1 Overview

The Powered Quadrant system can be broken down into three basic packages consisting of the following;

Portal & Quadrant ED 065 - 1

Hydraulic Power Unit (HPU) ED 065 - 2

Remote Control Unit (RCU) ED 065 - 3

2.2 HPU (Hydraulic Power Unit)

The HPU is housed within an enclosed frame, with the electrical control cabinet and hydraulic power system protected from the weather by. The HPU has a variable volume piston pump system for the drive. There is also an Oil/Air cooling fan system, fitted within the enclosed frame.

The basic power pack electrical controls are mounted on the electrical control panel, and are simple start stop push button controls with indicator lamps along with a mains isolator. Mains power is connected to the HPU via 125A 3 phase socket. There is 1 multi-core control 30m long cable, which connects the RCU to the HPU. When electrical power is present, and after the E Stop reset button has been pressed, the HPU motor can be Started/Stopped, at either the HPU, or from the RCU.

The power pack pump is used to control direction, and speed of the quadrant drive motors. The RCU must always be plugged into the HPU so as to have continuity in the E-STOP circuit.

Additionally, an extra E-STOP button and cable is provided if required.

2.3 RCU (Remote Control Unit)

Remote control of the Powered Quadrant is electrically operated from the Remote Control Unit (RCU). The RCU is used as the normal method of controlling the speed & direction of the quadrant.

This RCU provides the remote operator interface to the following HPU & Quadrant control functions.

The HPU can be started/stopped at the RCU, which is fitted with indicator lamps to show that power is available at the HPU, that the Hydraulic pump is running (once the start button is depressed), also a warning lamp to indicate problems that the HPU may have, such as over temperature etc.

An Emergency stop button is also provided to immediately turn off the HPU power, in case of an emergency situation.

The Joystick lever controls speed and direction, CCW/CW, and has the ability to manually control the speed & direction by moving the lever either side of the centre position, or by slowly rotating the top part of the lever (potentiometer) CCW/CW which, once the required speed is reached, the Joystick will be set at that speed setting without the need to hold the lever. Similarly by rotating the top of the joystick lever CCW/CW the speed can be reduced, or returned to the centre position to stop rotation.

The RCU is a portable sized console; this allows the RCU to be used as a 'Walkabout' control console. The RCU electrical supply is via the supplied control cable, one Harting Type multi-pin connector connect the RCU, via the supplied 25m multi-core cable to the HPU.

RCU (Remote Control Unit)
